Defect Report

Field	Details
Defect ID	BUG_LOGIN_001
Module	Login
Defect Title / Summary	Application allows login attempt with an invalid email format without proper validation
Defect Description	The Login page accepts an email address in an invalid format (e.g., abc, user@, test.com) and allows the login request to proceed. The application does not display a client-side validation message to inform the user that the email format is invalid. This violates standard email validation requirements and results in unnecessary authentication requests being sent to the server.
Environment	Stage
Application URL	https://tichi-app-webapp-stage.web.app/login
Browser	Google Chrome Version 136.x
Operating System	Windows 11 / macOS (as applicable)
Build Version	Stage Build (Latest Available)
Severity	Major
Priority	High
Status	Open
Reported By	Jay Suryaa R
Assigned To	Development Team
Date Reported	27-06-2026

Preconditions

1. The application is running successfully.
2. User is on the Login page.
3. Internet connection is available.

Test Data

Field	Value
Email	abc123
Password	Test@123

Steps to Reproduce

Step No.	Action
1	Launch the Tichi application in Google Chrome.
2	Navigate to the Login page.
3	Verify that the Email Address and Password fields are displayed.
4	Enter an invalid email format such as abc123, user@, or test.com.
5	Enter any valid or invalid password.
6	Click the Login button.
7	Observe the application's behavior after submitting the login request.

Expected Result

- The application should validate the email format before submitting the login request.
- An appropriate validation message such as **"Please enter a valid email address."** should be displayed.
- The Login request should not be sent to the server until the email format is corrected.
- The user should remain on the Login page.

Actual Result

- The application accepts the invalid email format.
- The Login request is submitted to the server.
- No validation message is displayed for the invalid email format.

Impact

- Users can submit incorrectly formatted email addresses.
- Unnecessary authentication requests increase server load.
- Poor user experience due to lack of input validation.
- Does not meet standard input validation practices.

Root Cause (Possible)

The email input field does not perform proper client-side validation before submitting the login request, or the validation regex is missing or incorrectly implemented.

Suggested Fix

1. Implement proper email format validation using a standard email validation pattern.

2. Display an inline error message:
 - a. **"Please enter a valid email address."**
3. Disable or prevent the Login request until a valid email format is entered.
4. Ensure both client-side and server-side validation are implemented.

Attachment

- Screenshot of the Login page showing the invalid email entered.
- Browser console logs (if applicable).
- Network request screenshot (if applicable).
